Contents

• Definitions and goals
• Achievements so far
• Walkthrough
• Testbed architecture and core technologies
• Future work
“A controlled environment for experimentation and evaluation, with metrics and benchmark content that allow comparison of tools and strategies”
Why do we need a Testbed for Digital Preservation?

- Perform scientific research in digital preservation
- Evaluate preservation approaches in diverse “real life” settings
- Avoid duplication of work
- Maximise use of invested resources

→ Need for a dedicated research environment
  - Systematic execution of experiments by different institutions with
    - automated evaluation
    - reproducibility
    - documentation and accessibility
Contribution of the Testbed to Planets

• To preserve digital objects, we need:
  – Preservation tools:
    • Characterisation tools
    • Preservation action tools (migration / emulation)
  – A preservation plan
• The Planets Testbed will give us:
  – Information on the usability of preservation tools and services in various conditions / on various types of data, e.g.:
    • Degree of perservation of certain characteristics of data
    • Speed of tool
  – Institution independent results (focusing on tools and data only)
  – (Aggregated) information will feed into the Planets Tools Registry
  – Information can be used in a preservation plan
The Planets Testbed

• Foundation for objective evaluation of preservation tools and strategies:
  – Load content
  – Perform experiments: select data and tools, run the experiment, evaluate results, compare outcomes
  – Provide support for validation of preservation strategies
  – Benchmark tools and services

• Consists of:
  – Data storage, hardware, Planets software, Testbed application
  – Benchmark content
Achievements so far

• First Testbed prototype release in September 2007
• Planets-wide first release of Testbed in March 2008
• Release to be used by Planets partners for digital preservation experiments in July 2008
• Planning for corpora established
• Planning for participation of external institutions established
First Prototype (Sept. 2007)

- Mainly intended for internal feedback on user interface
- No integration with Planets Interoperability Framework (e.g. single sign-on, user management, data registry)
- Main focus on the experiment design and the experimenter user type
- Execution still a mock-up
First Release (March 2008)

• Experiments can be fully executed
• Custom versions of certain Interoperability Framework elements, such as the Service and Data Registries
• Integration of the IF single sign-on service
• Limited number of Services available
• Services can be registered through the Service Registration Wizard
• Arbitrary migration services can be registered and used in an experiment
New in current release  
(V.0.6, July 2008)

- Experiment approval and scheduling system
- Expanded experiment search functionality
- Data browser for browsing and selecting experiment data
- Planets FTP area for supplying sample experiment data
- WebDAV interface for uploading and managing data available
- Significant increase in the number of available services
- Various updates to the GUI
Services currently available

- PNG to TIFF Converter
- JPG To TIFF Converter
- JPG to PNG Converter
- TIFF to PNG Converter
- Xena DOC to ODF and ODF to PDF
- PS to PDF Basic Migration
- OpenXML Migration
- Simple Characterisation
- Image Identification Service
The Testbed Experiment Process

Plan and Prepare Next Experiments (outside Testbed application)

- Decide on scientific strategy
- Define possible areas of interest
- Consider possibly interesting tool
- Consider experiment evaluation
- Wrap tool into service
Experiment methodology

• Built on work undertaken by the Dutch Digital Preservation Testbed and DELOS Testbed, but
  – Integration with Planets Interoperability Framework
  – Focus on workflow design and on automation

• Experiment Process: based on that of the Dutch and DELOS testbeds, but
  – different end-user typology → simplification (from 12 steps to 6)
The Testbed Central Instance and the Testbed software

• The Testbed Central Instance is hosted by HATII at the University of Glasgow
  – Available to all Planets partners at http://testbed.hatii.arts.gla.ac.uk:8080/testbed/
  – Experimenters are encouraged to use this central instance to ensure the seamless aggregation of experiment results

• A downloadable instance of the Testbed software is available for local installation at http://gforge.planets-project.eu/gf/project/ptb
Testbed Architecture: Key Principles

1. Designed to be platform independent, robust and scalable
   - Java Enterprise Edition

2. Designed to execute experiments on a wide array of preservation tools and services
   - Web Service approach: tools wrapped as web services can be accessed by the Testbed application by means of a platform-independent URI

3. Designed to be a part of the overall Planets software suite
   - Sharing of common components across the entire project
   - Testbed development can focus primarily on the components that are unique to the TB
Web Service Approach

- All preservation tools required for Testbed experiments are deployed and accessed as Web Services
- All tools must be wrapped as WSI-compliant web services so that
  - Services can be registered with the testbed
  - Service templates can be created
  - Experimenters can then access these templates to simulate the specific usage of a tool
  - The Testbed is **extensible**. Any WSI tool can be made available
- Steps involved in registering and configuring a service are handled by the Testbed administrator
Next steps

- Next releases
- Planning for corpora
- Planning of experiments
- Opening to external institutions
Planning for Corpora

• Digital preservation corpus: annotated collection of digital objects
  – Annotations should contain the criteria against which given algorithms will be evaluated

• By October 2008 a detailed plan for the building of the corpora will be in place

• Corpora will ensure that a sufficient knowledge base is available for each experiment
  → will avoid the duplication of effort for experimenters
Next steps (summer 2008):
1. Decide on good evaluation criteria
   – Make use of PLATO case studies
2. Decide on test strategy
   – (in depth testing of small sets / broad testing / tools for most common object types / tests on as many different object types as possible / etc.)
3. Set up a test schema
   – Get partners involved & monitor progress
4. Evaluate and continue
   – Use evaluation information to reconsider steps and continue
   – Broaden the automated evaluation concepts
Opening to external institutions

• Current areas of work:
  – Work out Testbed benefits for external organisations
  – Define criteria for filtering organisations
  – Establish key contacts in the organisations
  – Devise concrete testing tasks the organisations to be involved in
  – Assign timescales and resources for testing

• Agreement with external institutions in place by November 2008

• Opening of Testbed for external experiments by April 2009
Testbed – a walk-through

Thanks!
